integrate your salesforce with an ecm in less than 7 days

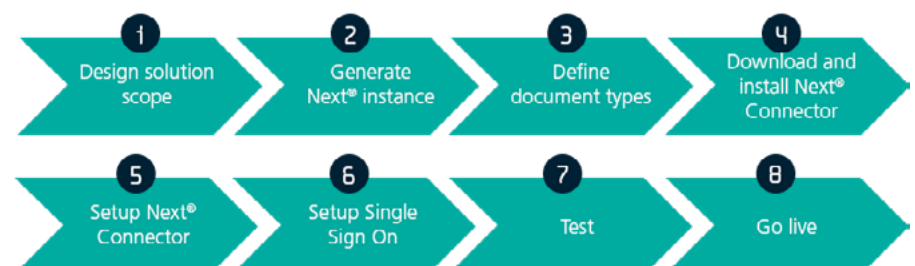

Implementing a new software solution in a company always takes time. More time than expected. Often much more time. But if you are looking to implement an enterprise content management (ECM) system for Salesforce, it doesn't have to be like that.

And why is that? Simply because we at Nextway listened carefully to the experiences picked up by our colleagues at [entero AG](#) – our highly specialized [Salesforce](#) partner located in Germany.

The result:

- The Next® Enterprise archive is preinstalled and online in Azure
- The Next® Connector for Salesforce is available in the Salesforce AppExchange
- The Next® Connector integrates fully configurable from within any Salesforce page
- Next® is setup with Salesforce as the IDP and provides seamless single sign on
- Next® supports Salesforce Object Query Language
- The Next® Connector overcomes the 12 Mb limit and supports gigabyte sized documents

With all of this in place, the implementation is a walk in the park.

Once [Next® for Salesforce](#) is implemented, you have one-click access to all relevant documents related to your prospects, customers, and projects. You add new documents to the archive using drag and drop. And documents generated in Salesforce are automatically uploaded to the enterprise archive.

Over time you will add more document types and integrate Next® with more business objects in your Salesforce solution. But this first implementation we'll have up and running within a week. Guaranteed!

// Now we can implement Next® for Salesforce in a matter of days

— Christian Schröder, Senior Consultant at entero AG
