

Flow Email Composer

1. Install the package.
2. Open the lightning flow you wish to edit or create one.
3. Drag and drop Screen Element to the canvas.
4. Select the component, Flow Email Composer in the Screen Component search wizard.

1. Specify Comma Separated email address for To, Cc, Bcc addresses.
2. If you've Org-wide address already setup, specify it in **From**.
3. You can **hide the E-mail template selection** if you want to compose the email on the go. Provide global constant, True/false as shown in screenshot.
4. Specify **Sender Display Name** if you want to display sender name in the From line of the email. Note that this cannot be set if org wide address is specified in **From**.
5. If you are using **Email Templates**, below steps need to be considered carefully:
 - a. The email body is evaluated based on values specified in **Email Template Id**, **Whold**, **WhatId**.
 - i. **Whold** represents a human object. For eg: Contact/Lead.
 - ii. **WhatId** represents non-human object. Eg: Any custom object or any standard object other than Contact/Lead.
 - b. Provide recordId of the record in **Whold** if the email template is for **Contact/Lead** else, provide the record Id in **WhatId**. The component will not work if there is improper assignment of **Whold/WhatId**
