WHAT IS THE DIFFERENCE BETWEEN INBOUND AND OUTBOUND LOGISTICS?

Inbound logistics refers to the movement of supplies, raw materials, and finished goods from a manufacturer or any other distribution channel to a warehouse or a retail store.

With a sound inbound logistics process, a business can restock their best-selling items just in time for the holidays and the festive season, introduce new products for sale, even-out process returns, and so much more.

Outbound logistics on the other hand deals with the movement of end products from a distribution or fulfillment center to the end consumer. Generally, the outbound logistics process starts with a placed order, then it moves on to warehouse packing, and finally ends with product delivery.

Supply chain management is heavily reliant on inbound and outbound logistics, and understanding the correlation and difference between the two can provide insights for developing a comprehensive supply-chain management strategy.

	Inbound logistics	Outbound logistics
Definition	Inbound logistics is the receiving of raw materials or products from a supplier to a warehouse	Outbound logistics are the actions required to get the final goods delivered to the end user
Processes	Materials management and sourcing, warehouse receiving	Shipping orders to end users, customer service involving deliveries
Touchpoints	Supplier, manufacturer, distributor, or product holder > Company, brand, retailer, or third-party logistics company	Company, brand, retailer, or third-party logistics company > Customers

OUTBOUND LOGISTICS

Outbound logistics processes are related to the movement of end products to the end user, often originating in a distribution or fulfillment center and then delivered to its final destination.

STOCK TAKE

Automate and manage all stock operations via stock management maintains a central repository of all details related to stock, products and items across chain of stores. Understand the stock mix of a company and the different demands on that stock. Stock takes is the physical verification of the quantity and condition of items held in an inventory or warehouse. This may be done to provide an audit of existing stock. It is also the source of stock discrepancy information.

The screenshot displays the 'Stock Take' application interface. The top navigation bar includes 'Order Management', 'Accounts', 'Products', 'ePOS', 'Sales Orders', 'RMA', 'Stock Run Rate', 'Dashboards', 'Reports', 'Milestone', 'Request Suppliers', and 'Stock Take'. The main content area shows a list of stock take records with columns: NEW, T1_NAME, T1_START DATE, T1_END DATE, T1_EMPLOYEE, T1_APPROVER, STATUS, DESCRIPTIONS, and ACTION. Below the list, a detailed view of a stock take record is shown, including fields for Name, Channel, Site, Employee, Approver, Start Date, End Date, Status, and Description. The bottom section displays a table with columns: Product Name, SKU, Stock Address, Batch/Serial Code, Available Stock, Stock In Hand, Variance, and Adjusted Qty. The table shows one record for 'Text Product 6 Normal' with a variance of 0 and an adjusted quantity of 190. The interface also includes a search bar, a 'Find' button, and a 'Showing 1-1 of total 1 Records' message.

ADVANCED PLANNING ALLOWS FOR INVENTORY OPTIMIZATION

End-to-end planning is essential to drive profitable, sustainable growth. Navigating the challenges associated with evolving product portfolios, dynamic markets, unavoidable constraints, and expanding networks creates a dizzying array of go-to-market options—and a widening gap between getting it done and getting it right.

Aqxolt's integrated suite synchronizes supply and demand, balancing customer expectations and business goals. Modular applications target key sources of complexity, leveraging a common platform to harmonize operations and strategy.

Advanced algorithms support demand sensing and supply planning, inventory and production planning, all to identify the best use of assets and optimize performance. Axqolt Integrated Business Planning goes beyond traditional sales and operations planning (S&OP) to enable a holistic perspective to align the entire organization in order to deliver overall business improvement. Having the appropriate systems in place to optimize inventory levels without sacrificing service levels is essential to remaining competitive in today's marketplace.

INTEGRATED WITH FEDEX, UPS DHL, USPS AND INTERNAL SHIPMENT

Multi-Carrier Shipping to create Shipments, Compare Shipping Rates and schedule pickups all within Salesforce.

- Create Shipping Labels and Estimate Shipping cost
- Shipment Pickup Management
- Shipment Automatic Tracking

Create Shipment

Generate shipping labels for any order and filter your orders based on customers

Rating / Quoting
