

ERP Inventory Management System for Manufacturers

Reduce inventory carrying costs and errors with detailed traceability across your supply chain with end-to-end visibility to the sales process for available-to-promise dates; the ordering process with material requisition planning (MRP); and on into the service process to ensure customers get the products they need when they need them.

Lower Inventory Carrying Costs

Optimizing manufacturing operations can be difficult when excess inventory takes up valuable space and capital. You need to minimize the time and costs to process raw inventory into finished goods but that is difficult if you don't have visibility to what you have, why you bought it, and what order it needs to fulfill.

"Rootstock transformed our processes related to operations, inventory and production overnight."

— Tim Purdie, CIO, Tilray

Reduce Errors with End-to-End Inventory Accuracy

Accurate inventory management is critical to minimize losses and maximize profits. Inventory errors can create long-lasting impacts including significant financial losses for manufacturers such as waste through spoilage, increased costs from lost materials or obsolescence. These errors result in direct cost to waste or carrying costs until consumed in production.

"Our inventory guys recently (said) they never want to go back. That's by far the main benefit that we've had, the additional inventory management and control along with MRP."

— Raymond Beiler, VP, Equipter

Inventory Locations at Your Fingertips

Misplaced or unaccounted for inventory can be frustrating and slow down production processes and result in delays, leading to decreased efficiency and productivity.

"We know what's on hand in our inventory at all times, where it is, is it sitting waiting to be worked on or if it's in a cage to be sold. All of that is all real time."

— Sonia Smith, Controller, Summit Imaging

Benefits/Solutions

LOWER INVENTORY CARRYING COSTS

Reduce Your Inventory Investment

- Visibility to ALL inventory information in all sites and all company sites, including summary and detailed review by item, to make informed decisions that help increase inventory turns
- Accurately track field installation with device history, location information, and multi-level “bill of numbers”
- Leverage allocations for materials planning, allowing you to reserve items for specific orders/lines.
- Real-time valuation reports to reflect accurate value for on-hand inventory in all company sites

REDUCE ERRORS WITH END-TO-END INVENTORY ACCURACY

Ensure Accurate Inventory

- Ensure accurate records with detailed inventory transactions performed within Rootstock
- Use standard cost, actual cost or FIFO costing, and manage costs at the project level if required
- Analyze supply and demand requirements in real-time, to update inventory by location, lot number, serial number or project as it moves through production
- Manage inventory in real time from anywhere you are, using a standard mobile phone or tablet
- Customize your cycle counting with suggested counts based on your own parameters or ABC category analysis

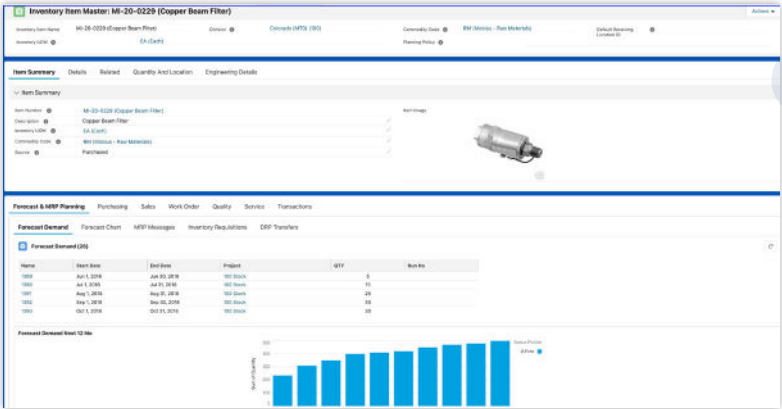

INVENTORY LOCATIONS AT YOUR FINGERTIPS

Supplier to Customer Traceability

- Register lot numbers through purchasing receipts, inventory, shop floor control and sales orders
- Assign serial numbers to inventories and track them all the way to delivery, installation and in the field
- View full-level traceability trees and comprehensive device history records
- Track inventory while subcontracted outside your operations or while at contract manufacturers
- Create locations for customer-owned, consigned inventory being held at manufacturer

Easily Classify Inventory with Item Attributes

- Pre-assign inventory types in any location or assign them on the fly
- Detailed classification for quickly identifying specific materials
- Maintain common or project inventories by item within a division, site, and location level
- Track costs and quantities at the item level
- Manage containerized inventory using license plating
