Salesforce to Salesforce migration

Data migration Service for full data migration from one Salesforce ORG to another

Simple data migrations may be carried out using data loader, jitterbit o similiar tools.

Complex data migrations from one ORG to another ORG can not be accomplished with such means.

We offer a out-of-the-box Salesforce to Salesforce data migration service in which your Sales, Marketing and Service Cloud can be migrated fast and efficiently.

There is a knowledge article on help.salesforce.com called „Steps to migrate data from one organization to another“ with article number 000005202.

However many complexities of data migration are not touched in this guide and therefore remain unresolved.

For example, to migrate campaigns, campaign members must be migrated too, which requires leads (including archived leads) and contacts.

The migration of task and event is never mentioned. Task and event can be linked via whatId to virtually any object, and the whoId can be linked to either contact, lead or queue.

We offer a Salesforce to Salesforce

migration service that covers most Salesforce standard objects plus custom objects. Custom fields can be included according to mapping tables to be provided.

Scheduled data connections allow you to check your data in the target environment and to repeat the migration step as often as required.

All Salesforce Ids of the Source ORG will be replaced with Salesforce Ids of the target ORG. This includes many Salesforce objects that can normally not be easily migrated such as tasks, events, attachments, knowledge articles.

The migration will run on our own cloud based infrastructure. No licenses or servers needed.

Based on **Talend** and **Salesforce Technology** we are offering:

- Most powerful Salesforce to Salesforce migration offering on the market
- Any to Any Migration, Salesforce to Salesforce migration
- Include data from other source systems
- Respect creation date of source system: create records in target

system with historical creation date and optionally correct OwnerId
