

Rocketseed for Salesforce Release Notes

Rocketseed's Email Media app for Salesforce is fully documented in the Salesforce App Exchange listing available here:

<https://appexchange.salesforce.com/listingDetail?listingId=a0N30000000q7ZeEAI>

Release notes for the current and previous versions are listed below.

Version 1.8.1 - current version

<https://login.salesforce.com/package/installPackage.apexp?p0=04t90000000kZr4>

When composing an email inside Salesforce, the Rocketseed banner identifier is inserted using the briefer numeric format in the subject line, rather than the banner name.

Version 1.8

This version adds the ability to specify a default Salesforce user who will own Leads created by Rocketseed. Clicks on mails sent by recognized Salesforce users are automatically assigned to that user; clicks on mails sent by others in the organization will be assigned to the default user specified here. Previously those Leads were assigned to the Salesforce user who installed the application.

Version 1.7.1

This patch corrects a potential conflict with some other apps that may also use VisualForce page overrides. In some installations the Rocketseed button was not functional due to the conflict.

Version 1.7

This version embeds updated Rocketseed icons in the Rocketseed Alerts screen and Related Lists screens. Additionally it provides better control to set up in an EE org so that ordinary users cannot delete Rocketseed Alerts; this is controlled by reducing the rights assigned in the Rocketseed user profile. The "Tracker Tags" field has been renamed to "Tags"

Version 1.6

Nomenclature changes to ensure consistency across the application. The new data entity created by our app is referred to as a Lead Alert throughout the user interface and documentation.

Version 1.5

Original version
