Lightning DataTable : User Manual

App Overview

Lightning Data Table helps you to display records in a table format without writing any code. This table has features like Sorting based on columns, searching the entire table data.

This lightning component is a generic one, so it can display records from custom as well as standard object based on the query passed as a parameter to the component.

This is a time saving tool for developers as well as administrators. They can create table along with data they want to display in a very less time with added functionality of sorting and searching.

Prerequisite

1. Install the Managed package in your org.
2. Call the component along with the parameters you need to pass for displaying the records

eg: `<ldataTable:Lightning_Data_Table_Component Object='user' queryFields='id,name,email,username' fullQuery='select id,name,email,username from user'></ldataTable:Lightning_Data_Table_Component>`

3. **Object** - Name of the SObject

4. **queryFields**- Name of the Fields to display eg: name__c

5. **fullQuery** - Full SOQL Query

* If the Field queried by user is not visible to the user under security settings ,then that fields will not be displayed in the table.*

Features:

- Generic Component.
- Sorting on individual column.
- Searching through the table on all column.
