

## Filtered Tiles - Instructions

Thanks for choosing to use Filtered Tiles.

These setup instructions should be pretty easy to follow and won't take long to get you up and running.

1. Create a new Tab for the 'Tile Item' custom object. Each Tile Item record will represent a tile in the Lightning component.
2. In Setup, give your users permissions to the 'Tile Item' object based on their profiles.
3. In 'Setup > Picklist Value Sets' you'll find the 'Tile Type Picklist' set from the managed app. Here you can edit and create your own 'Types' for Filtered Tiles.
4. Create some 'Tile Item' records, the fields are:
  - Name - The name of this Tile Item. Label within component
  - Link URL - An option URL link for the Tile Item
  - Photo URL - A photo to display within the Tile Item
  - Rating - A 1-5 Rating for the Tile Item
  - Type - Inherited from the Global Picklist Values.
5. Drag & Drop the 'Filtered Tiles' component onto your Community or App using the Community/App Builder.
6. Configure the component from within the builder. Labels, colors etc. can be branded as well as the option to show/hide the Rating and Type filters.
