

Know Notifie!

Notifie is one of those unique utilities which when used along with the capabilities of App Builder, proves to be of great use for any organization.

Here's what Notifie can do –

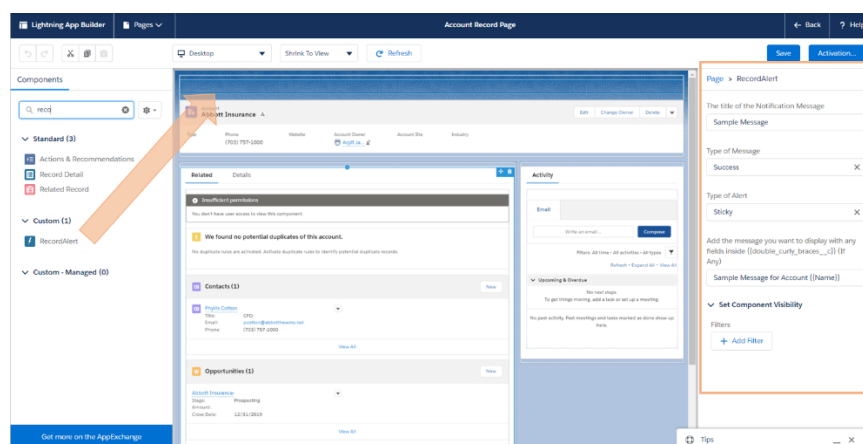

1. Flash an alert on your Lightning Record Page based on what you want to highlight about a specific record. Maybe you want to flash an alert on a high revenue account, maybe you want to display an alert on an opportunity due follow up, etc. all this can be achieved through Notifie.
2. “Having an alert with some predefined text is all cool, but can we use it to display some actual data?” – Of course, you can. More details ahead.

A. Setting it Up!

Setting up Notifie in your organisation is really easy. Just follow the below steps and you'll be all set –

1. Get the package from AppExchange to be installed in your org. Yes, the famous **Get It Now** button, that's it. No Prerequisites, no extra steps, just install it directly in your org. Fairly simple, isn't it?

After you have got the package installed, navigate to any of the lightning record page on which you wish to set up **Notifie**. Edit the page and drag the **RecordAlert** component on the canvas.

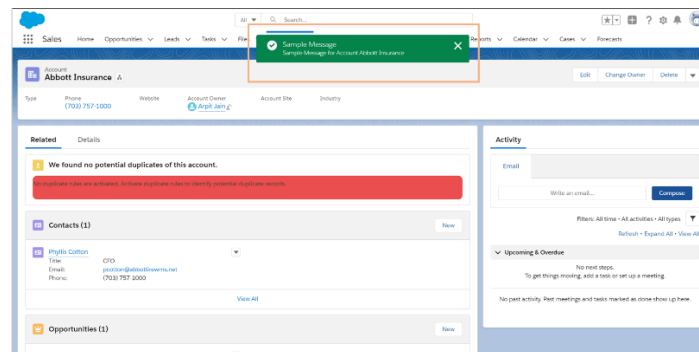

1) Then you'll get a bunch of options to configure the alerts -

- a. **Message Title:** Title of the Alert
- b. **Type of Message** – Depending on what type of message you want to display, you have 4 options to select from - Success, Warning, Info, Error
- c. **Type of Alert** – Dismissible and Sticky are the two available options. Sticky makes sure that alert message is persisted until the user choses to close it.
- d. **Message** – The actual text message which can be a static message or might include object fields, each inside double curly braces: {{FieldName__c}}

3. That's it!! As soon as you save the changes and go back to the record, you should see your hard work bearing fruits!

a) Success Message

b) Warning Message
