Version 1.4

Date: 22.07.2021

Title: Bug Fix long Record Types

Requested by: Peter McDowell

Description: The Field Set API Name can only be 40 characters. If the record type name is really, really long (more than 32 characters), the field set name can not be the same name. Therefore only the first 32 characters of the record type name are compared.

Version 1.3

Date: 22.07.2021

Title: Automatically close modal and added spinner

Requested and developed by: Kaushal Gautam

Description:

Once the update is done (after user has filled out the fields in the form and submitted the form), the form should close

1. if launched via quick action, the modal should close
2. if launched as an LWC from the record page, the form should disappear and the component should go back to its initial visual state.

Furthermore, while the component is being loaded/the form is submitted and record is being updated, we can show a spinner to let the user know that processing is going on. This is to add to the user friendliness of the app.
