

Release Notes

- ✓ **Smart Dashboard with improved features**
- ✓ **Real-time information about duplicate groups and records in your org**
- ✓ **Fuzzy logic for selecting the record to retain (Master record)**
- ✓ **Intuitive UI & User Experience**

Being Salesforce Native, **Duplicate Search & Merge** keeps your data safe, no need to migrate your data in and out of Salesforce but, with that comes some limitations due to restrictions in Salesforce. We value the safety and security of your data more than anything. So, the current version has the following limitations:

- a. Duplicate Search & Merge processes up to 1,000 groups and 50,000 duplicate records on an object at a time.
- b. Saved Query can only be scheduled up to 6 months from the system date.
- c. DSM displays up to 75 records for reference in the popup for modifying master records manually.

Known Issues: -

- a. In the Update Master popup, time fields are not rendered properly. Changing the value in this field gives error and doesn't allow saving the record.
- b. Your merge job could fail due to one of the following reasons in your org:
 - Trigger(s)
 - Duplicate Rule(s)

We are working to resolve the issues and move past some of the limitations & hope to give an even better product soon.

We value your feedback, so if you have ideas or suggestions on how to make our app even better then email us at DSM@mirketa.com. If you are happy deduping, please leave us a rating and review on AppExchange.
