

Oktana specializes in custom software development and integrations across a full range of Salesforce technologies, including Heroku and MuleSoft. As Salesforce experts, we help companies connect their systems to Salesforce to enable an intelligent and delightful customer experience.

For MuleSoft customers, Oktana is the right partner to build a custom app leveraging data exposed through MuleSoft or to integrate systems with other Salesforce products.

Heroku Projects

VC Firm Social Media Monitoring

A Silicon Valley VC firm needed a notification system to alert the firm to social media spikes within its portfolio of companies. We first built an app on Heroku to collect the data in real-time. After migrating the collected data into Salesforce, we built a user-friendly app on the Lightning Platform to visually display the data.

Telehealth Company Patient Data

A platform to facilitate house calls between high-risk patients and their medical team needed to connect its healthcare systems to its Salesforce org to streamline patient data processing. Using Node.js, we built a custom Heroku app. To ensure HIPAA compliance, we created Salesforce custom objects to store all client data on the back-end.

B2B Learning Management System

We have been involved in the development of several high-profile B2B LMS platforms including for the world's #1 CRM company. In addition to helping to maintain the core code in Ruby on Rails on Heroku, our contribution has included design, data modeling and development of an interface for content management and standardization.

MuleSoft Projects

Interior Design Software Provider

As the largest US provider of interior design solutions for the building industry, this company needed a community to manage its API users. We implemented Anypoint API Community Manager to showcase APIs and share technical documentation, including a "try it now" mock query feature.

Leading Software Monitoring Company

This well-known IT data monitoring and analysis company needed a branded portal to manage internal API users with custom sharing and visibility that leveraged SSO. Alongside the MuleSoft team, we enabled this with the implementation of Anypoint API Community Manager.

Heroku + MuleSoft

Heroku's flexible development platform and available Postgres database enables developers to build, manage and scale apps quickly. When combined with MuleSoft's integration and API platform, we can efficiently connect any data from any system to any app.

We also help you integrate:

Lightning Platform
AppExchange
Einstein AI

Sales Cloud
Service Cloud
Experience Cloud

Tableau CRM
