

DISEASE DISCOVERY

Beacuse you
need more than
just recapture

Relying on recapture alone for your HCC coding will inevitably result in missed RAF scoring opportunities and under-documentation. Your EHR vendor may offer a simple tool that performs recapture but those tools rarely work for your new patients or for patients with progressive diseases like diabetes.

Disease discovery harnesses the power of the ForeSee Medical artificial intelligence engine, and a complex set of proprietary algorithms, to discover diseases that HCC code recapture alone simply never will. In fact, when we studied a well performing organization after patient diagnoses were documented at annual wellness visits the number of new disease suspects dwarfed recapture suspects by around a 4:1 ratio, with meaningful RAF score improvement opportunities.

If you participate in value-based reimbursement models, disease discovery for risk adjustment coding is keyed to high quality care and consequently, sustainable profitability.
