

Think your software already assists with HCC coding and RAF scoring?

Ask yourself, does my current software have...

- **Artificial Intelligence** with natural language processing (NLP) that reads unstructured data (PDFs) of hospital discharge summaries, PCP notes, consults, lab and radiology reports?
- **Intelligent Recapture** that alerts for codes used in the prior year that don't have the proper support documentation in the current year?
- **EHR Integration** that presents risk adjustment suspects conveniently on your EHR screen at the point of care along with HCC coding recommendations?
- **Hyperlinks to Original Documentation** that allow you to click on a suspect and immediately display the exact page of the original documentation with the disease highlighted on the screen?

Simple recapture is not enough, human review is too slow and coding without support is a "hassle" for providers. With ForeSee Medical your team will discover new opportunities, improve quality and increase the profitability of your Medicare risk contracts.
