

Security overview

Evisort contract intelligence for Salesforce

How does Evisort handle security related to the integration?

The Evisort contract intelligence for Salesforce application adheres to both Evisort's and Salesforce's rigorous security and data privacy policies and best practices. The app is listed on Salesforce's AppExchange and it goes through Salesforce's comprehensive security review so our customers can feel confident in knowing Evisort provides the highest level of data protection.

Evisort is the first AI-native CLM company to be ISO 27001:2013 certified for information security and ISO 27701:2019 certified for data privacy. Evisort's diligent management system ensures the confidentiality, integrity and availability of all corporate data. These certifications establish, implement, and maintain privacy information management protocols that comply with a wide array of international privacy regulations, including the GDPR and CCPA.

The Evisort platform is SOC2 Type II certified, conducts regular penetration testing, continually runs a worldwide bug bounty program, and has an up-to-date DR plan.

The Evisort Contract Management for Salesforce app runs on the AppExchange infrastructure and passed (and is reverified when we release updates) Salesforce's security review, which verifies that Evisort rigorously adheres to the OWASP Top 10 by hardening our code to mitigate the risks and minimize the vulnerabilities listed in the review.

We encrypt data in transit between Salesforce and Evisort with TLS 1.2+ and we provide access controls to manage which types of docs and metadata are shared between the systems.
