

Protocol Labs is an open-source research, development, and deployment laboratory working on projects including IPFS, Filecoin, and libp2p.

We've worked with Protocol Labs building open source and internal tools. Some things we've worked on with PL include testing and optimizations for libp2p's gossip sub protocol in preparation for its integration into ETH 2.0, building a network inspector style debugging tool for the Kademlia DHT implementation of go-libp2p, creating a network visualization and debugging tool using WebGL for Filecoin, and creating a Filecoin browser extension among other things. We are also a proud winner of the Slingshot Challenge .

*"We've needed to provide less direction and hand-holding to them compared to most any other contractor or development shop. The quality of their work is very competitive with other providers."*
