AppExchange Package

Global RADAR is the leader in client onboarding, customer due diligence and transaction surveillance.

Create an application in Salesforce that uses Global RADAR capabilities to verify accounts, contacts, and leads.

Challenge / Problems

Global RADAR platform was popular enough on its own - the client decided to expand their client list by doing a Salesforce integration. It was necessary to make a stable application that screens not only a single record, but the system as a whole.

Solution

A managed package was made and released to the App Exchange. The package has done deep integration with Global RADAR, which both sends and receives information.

Results

The package already has up to 10 active users and is being actively maintained and updated.
